

IT'S SICKENING

How much money you can lose in the hog business!

Disease impacts cash flow more than any other problem in our industry.
PRRS, PMWS...

It's enough to make your head swim
and your stomach churn!

Suppliers might hand you relief the same way they would try to cure a hangover – prescribing the very thing that made your life *miserable* in the first place: replacement animals that may carry more diseases!

When he coughs up yet another "quick fix," call us.

Need relief?

Get rid of the biggest risk: live animal introduction.

If you've already closed your herd, and it's still sickly, call us. We know how to close a herd the right way, and we can help.

No one knows that better than Babcock.

We began our state-of-the-art **nucleus herd** in 1970 and populated it by hysterectomy, then **closed** it to live animal introduction. Then we **strengthened** our closed commercial breeding system with rotational cross-breeding instead of using weaker pure lines.

The results?

Healthier herds resistant to many of the remaining risks that may lurk in wind, insects, trucks, humans, and other vectors.

Call Babcock Genetics and get our money-back Performance Guaranty in writing. And make your herd – and your head – feel better!
